

## **New breakthrough puts fish oil in Australian diet**

In Australia, a new alliance between Clover Corp. and Food Science Australia will utilize a novel breakthrough technology to put healthy fish oils into the Australian diet. Fish oil, a popular functional food, offers various health benefits, but its use as an ingredient in processed foods is limited owing to taste and stability problems. The new process, a food ingredient encapsulation technology, appears to satisfy all the demands of an improved carrier for unstable materials like fish oil. Research has indicated that the encapsulation technique can be used to incorporate Clover's HiDHA<sup>®</sup> tuna oil into liquid and semi-liquid foods such as milk drinks, yoghurts, cheese and ice cream.
