

## **New technology enhances food product consistency**

Think Gates™ technology developed by BOC Group, the United States, offers food processors a means to improve plant production issues of fluctuating yield, poor efficiency and product inconsistency. The new system monitors the state of the food product as it moves along the entire production process. Think Gates technology consists of a total package of reliable monitors, sensors, software and related networks that are capable of withstanding the harshest plant floor environment. Data is then consolidated and converted into easy-to-use plant floor display screens and visual alarms to be used by all workers to make important, production-related decisions.

The Think Gates business will be run by Thinkage LLC, an independent management company. The on-site service company will offer solutions for processing problems.
