
Hot air systems for thermal recycling

Talbott's Ltd., the United Kingdom, is pioneering a novel "thermal recycling" concept, which promotes on-site combustion of waste. One of Talbott's thermal recycling system installed at a decorative mouldings production facility eliminates waste and concurrently provides heat to the facility. The C9 automatic warm air heating system produces 2,500 kW/h and 55,000 CFM at a high working pressure to ensure good and distant distribution of the warm air. This output is produced by combusting 50-60 t/week of waste. Talbott's range of systems are designed to meet all current and future emission requirements.
