

Powerful 'multibrid' technology

A 20-25 per cent reduction in energy production costs can be achieved by employing 'multibrid' technology. Multibrid offshore wind power parks produce more than 20 million kWh/y. The encapsulated turbine systems incur minimal maintenance and operating costs. Single-stage planetary gearing coupled with the slow-speed turbine produces less wear and tear. *Contact: Corporate Development/Marketing, Elexis AG, Ulmenstraße 22, 60325, Frankfurt am Main, Germany.
