

IBR technology for China

International Bio Recovery (IBR) Corp., Canada, has entered into an agreement with 'strategic investors' for utilizing IBR's novel fertilizer production technology in China. Plants based on IBR technology would be set up in China to convert organic waste into valuable fertilizer products. Plans are underway to construct and operate IBR plants under the terms of a Master License Agreement between IBR and the Canada Pacific Sunshine Technology Co. Ltd. Canada Pacific has already signed an agreement to establish a joint enterprise in the City of Nanhai, Province of Guangdong. The initial annual production scale of the joint enterprise shall be the treatment of 220 tonnes per day of urban organic waste.
