

Waste plastic used in construction

Industrial Consultancy and Marketing Services, India, has developed technology that facilitates the use of waste plastic in construction. It is a well-known fact that plastics do not degrade easily and are a cause for deep concern. The new process is an ideal solution for getting rid of this environmental hazard. In this process, waste plastic is reduced to minute pieces and mixed with cement solution to obtain a paste. The paste is filled in the cavities of hollow bricks/blocks and finally sealed with concrete. The company has developed a completely automatic system for this purpose. *Contact: Industrial Consultancy and Marketing Services, Opp. RDO Office, M.K Road, Chengannur 689 121, Alappuzha Dist., Kerala, India.
